

Your security is our number one priority. We use the latest technologies to ensure that your data is always safe.

- Industry leading 256-bit SSL data encryption
- Secure auditing, logging, and monitoring
- Redundant and HIPAA-compliant cloud data storage

Our Infrastructure

Authentication

Our military-grade authentication system protects the user and their data by ensuring authorized access to their information and records.

Encryption

The application creates a secure SSL tunnel through our proxy using 256-bit AES encryption. All information is encrypted throughout transit and storage.

No Local Storage

All information in our application is never stored on the local device. It is transmitted to our secure encrypted servers, further protecting your data from any malicious attack.

Protected and Private Cloud

Each organization's data is completely segmented from all other organizations using our services. Access is allowed only through properly authenticated channels. Our cloud environment provides you with:

- Encryption
- Data Backups
- Disaster Recovery
- Logging
- Monitoring
- Vulnerability Scanning

Data Redundancy

Our secure environment includes regional redundancy across North America to protect your data. We store all data, including audit logs, securely for seven (7) years.

Complete Audit Trails

We maintain a complete audit trail of all activities in the system, including user information, timestamps, and all actions taken. The centralized logging solution is designed to monitor activity and actions that occur within the environment. In addition, we keep detailed logs of each organ donation, procurement, and transplant for internal recordkeeping and auditing.
